## Foreword

The VALORIZA – Research Centre for Endogenous Resources Valorisation is a Portuguese research unit created in 2018 in the Portalegre Polytechnic University, as a multidisciplinary research center, being evaluated as VERY GOOD by the Portuguese Foundation for Science and Technology (FCT) and having obtained funding in the period 2019-2023 (then extended to 2024).

Over that period, the number of integrated members had always growing, going from 23 integrated members in 2018 to 35 integrated members in 2023, reaching a total of more than 700 publications, including articles, books and book chapters, going from less than 10 projects in 2018 to more than 50 projects approved in 2024 and from an execution of financed projects of around 200.000 euros in 2018 to more than 4.000.000 euros in 2023.

In strategic terms, one of the elements that guided us throughout this period was the fact that, during the first evaluation by the panel of experts, coinciding with the creation of VALORIZA, the lack of projects with an international impact was identified as a weak point. Over time, without neglecting the investment in projects with regional and national financing and action, several VALORIZA researchers made applications for international projects, ending 2023 with four European projects underway, financed by Horizon Europe, including the coordination of a COST action, with financing exceeding 3 million euros (while in 2024 we already had another new European project approved).

The present report is organized as follows: Chapter 1 presents the overview of the center, with a general description, the main contributions, the way as the activity plan was fulfilled, the research lines and the composition of the center. In Chapter 2, the report shows the main indicators, which some of them are then described in the Publications (in Chapter 3, split by articles published in Scopus indexed journals, articles and chapter published in scientific books and also published books), in the number of supervisions (in Chapter 5) and in the number of funded research projects (in Chapter 6). In this particular, the list of projects is extensive, and allowed the research center to achieve very relevant levels of collaboration and international recognition. On the one hand, expanding the network of international collaborations, both at the level of HEI and at the level of business partners, both within the scope of national and international projects. A very relevant example is, once again, the project Guardiões, which allowed not only the involvement of CPLP countries but also the recognition of the UN itself as an example of good practices.

4

The report also has information about the editorial activities of the members, the presentations at conferences and seminars as well as the events organized by VALORIZA.

Actually, the VALORIZA has a higher laboratory intensity. In fact, the unit carries out applied research, developing technologies using industrial and pilot equipment, developing work in partnership with industry. Some of the equipment is as follows:

**Gasification Plant - Fluidized Bed Reactor | Fluidized Bed Gasification Unit.** The fluidized bed gasification unit is a semi-industrial unit, with a raw material consumption capacity of up to 100 kg/h and a reactor about 5 meters high.

**Gasification Plant - Fixed Bed Reactor | Fixed Bed Gasification and Energy Production Unit.** The gasification unit (Power Pallet 20) produces electricity through the thermal gasification of fuels from different sources, where forest, domestic and industrial by-products stand out. It has a production capacity of up to 15 kW of electrical energy with a consumption of about 20 kg/h of biomass.

**Bi Fuel engine | Bi Fuel Engines (Otto and Diesel).** The Otto and Diesel engines make possible to study, with the partial or total addition of syngas, biogas and hydrogen, the behavior and emitted emissions of these types of engines.

**Biomass Boiler | Boiler.** The boiler allows the heating of sanitary water through the burning of biomass. It consists of the burner and water tank and a separate silo where the biomass is placed (usually pellets). The equipment allows the programming of a sanitary water temperature and will carry out the consumption of pellets according to the desired temperature. The debited power is between 20 and 30 kWth.

**Anaerobic Biodigester | Biodigester.** The equipment with a treatment capacity of 2 m<sup>3</sup>, allows the control of temperature, pressure, and agitation. Once the equipment is loaded, the bacteria start the co-digestion process, degrading the organic matter and producing biogas and biofertilizers (liquid and solid). In addition to the bioreactor, the equipment also includes two tanks: one allows the removal of the sample from the equipment and the other tank allows it to be fed.

**Anaerobic Biodigester Set | Biodigester.** Set of four 8-liter biodigesters, which operate in conditions like the 2 m<sup>3</sup> bioreactor. Biodigesters complementary to the process with greater capacity and which aim to study the behavior of various mixtures of effluents, so that they can later be replicated on a semi-industrial scale.

**Electrolyser | Fuel Cells and Hydrogen.** Dry hydrogen production electrolyser, pure (99.9%) and compressed at 30 bars. This technology uses a cell with a solid polymeric membrane, producing hydrogen of excellent quality and at a low production cost.

5

**Fuel cell | Fuel Cells and Hydrogen.** The fuel cell is an electrochemical cell that permits the chemical energy of a fuel (hydrogen) and an oxidizing agent (oxygen) into electricity through a pair of redox reactions. The equipment produces 24 V of electrical energy.

**Pelletizer | Biomass compression.** The pelletizing unit allows compressing the ground biomass and transforming it into pellets, small 6mm cylinders, with high energy value and low moisture content. This pelletizing unit has a power of 3 kW and allows the production of up to 50 kg/h of pellets.

**Mill | Biomass milling.** The mill with 100 kW of power is an auxiliary equipment to produce pellets. The material to be powdered is introduced through a feed system, which controls the flow and removes stones and metals, before entering the crushing chamber, where it is ground by the high speed of rotation of hammers. The unit crushes and grinds biomass to diameters of less than 3 mm, and has a processing capacity of over 1000 kg/h.

**Rotary dryer | Biomass dryer.** The rotary dryer with a capacity of 3 m<sup>3</sup>/h, basically consists of a rotating cylindrical drum where heat is introduced through a biomass boiler and material to dry, in concurrent.

**Solar concentrator | CPC.** The CPC unit ("Compound Parabolic Concentrator") is a photocatalytic decontamination reactor.

**Instruments | Scale - moisture content.** The OHAUS scale, model mb200. It incorporates a thermal resistance that allows the removal of moisture present in the raw material, while weighing.

## 1. Overview

### 1.1. General Description

VALORIZA is a multidisciplinary Research Unit (RU) located in Portalegre, a low-density territory with a rural and cross-border matrix. Due to its location between three metropolitan areas (Lisbon, Madrid and Seville, where live more than 10 million people), it exhibits a strategic geographical centrality. Its scope of activity and strategic objectives converge towards the valorization of endogenous resources, in compliance with the principles of circular economy, in low-density territories, which represent about 2/3 of Portugal.

The RU objectives are the promotion of applied research activities based on experimental development and on knowledge production and transfer, with potential impact on territorial development processes and dynamics, and the research and valorization of endogenous resources not only but more focused on low-density cross-border territories.

The RU research team was organized in an inter and multidisciplinary way, bringing together competencies in multiple fields of knowledge, which in different ways and from different perspectives work on the valorization of endogenous resources in low-density territories related questions, concentrating its main research effort on three core thematic areas: (i) Energy and waste valorization; (ii) Sustainable production and the environment; (iii) Valorization of low-density crossborder territories.

VALORIZA integrates many Laboratories to support education, training and research processes, and also several other infrastructures committed to the promotion of applied research, graduate education, innovation, technology transfer, internationalization, knowledge dissemination and entrepreneurship, highlighting its applied nature. It is possible to highlight some relevant labs and research structures for the different domains: Bioref colab and Hydrogen Academy for Energy and waste valorization or InnovPlantProtect and Inovtechagro for sustainable production and environment, research domains linked circular economy, where Alentejo Circular Lab could be indicated for this research domain. Most of those structures are directly coordinated of with a strong linkage to the RU (for detailed information see 5.2 and 5.4).

Assuming itself as an RU strongly committed to the territory, VALORIZA integrates into its research agenda a set of scientific and technological challenges aligned with the regional smart specialization strategy, namely: food and forestry, economy of the mineral, natural and environmental resources, critical technologies and energy, and technologies and specialized services of the social economy. In fact, VALORIZA represents an added value with the potential to promote sustainable valorization of endogenous resources in a low-density, cross-border and rural territory, since it embodies the opportunity to have a valuable team of researchers focusing on specific problems and challenges of a territory where there is no other HEI and/or RU operating within a radius of more than 100 km, thus contributing through its experienced transdisciplinary research team to improve the competitiveness and internationalization of the regional economy by focusing on the advantages of the scientific and technological system, matching knowledge and human capital as a catalyst for socioeconomic development.

## 1.2. Main contributions in the period 2018-2024

Among the many contributions that it is possible to identify at the research center, during the period in question, we identify in this section contributions related to: 1) Waste recovery; 2) Hydrogen and renewable gases; 3) Sustainable agriculture; 4) Environment and climate change; 5) Circular economy. The first two contributions are related to the center's first line of research (energy and waste recovery); the following two contributions are related to the center's second line of research (sustainable production and environment); the last contribution is related to the center's transversal activity, related to the circular economy.

1. The generation of knowledge in the area of bioenergy, in particular, the production of renewable gases (hydrogen, methane, synthesis gas) from residual endogenous resources. Has been contributing on the development of cutting-edge technologies for hydrogen and renewable gas production. This involves the exploration and refinement of various methods aimed at high TRL, to achieve high efficiency and minimal environmental impact by using thermal gasification, electrooxidation and anaerobic digestion technologies. Thermal gasification processes are employed to produce renewable hydrogen from dry biomass sources wastes and residues. This involves research in conversion of biomass into a synthesis gas (syngas) through high-temperature reactions in the presence of a controlled amount of oxygen and steam. The syngas can then be further processed to isolate hydrogen, which serves as a clean and versatile energy carrier. The contribution has been in optimizing gasification techniques to enhance efficiency and yield in hydrogen and renewable gases production.

2. The developed research done in VALORIZA enabled the use of numerical and analytical tools to facilitate solutions for the long term of energy-related societal problems, namely through the: a) development of energy-economic models to assess emissions, energy and economic outcomes from several scenarios of Portuguese and European policies to mitigate greenhouse gases; b) analysis of fluid dynamic problems found in the engineering practice of waste-to-energy processes (combustion, gasification, pyrolysis, etc.); c) development of specific waste blends to produce high quality syngas in quasi-industrial gasifiers, by means of experimental and numerical approaches tied by validation and uncertainty quantification techniques.

3. Agriculture and sustainability have been an essential element of VALORIZA's research since the beginning, with a main focus on water issues, not least because of the crucial role that this resource has in the region (Alentejo), considering its agricultural potential and the conditions of the environment, related to climatic conditions or the existence of intensive crop areas. Water is, therefore, an essential resource not only to guarantee the necessary production, but also to ensure environmental sustainability, with water management and its efficient use being a constant challenge.

4. Within the scope of research into the environment and climate change, we highlight the project Guardiões, an action-based research project, associated with environmental and climate change awareness, with a transversal impact, which crosses the entire society, highlighting the involvement of more than 3000 students in the different study cycles (from the first cycle of basic education to higher education) and the presence of more than a thousand people in the five conferences that were organized, in which the themes of education and knowledge, energy and just transition fund, mobility and rail transport, and circular economy were discussed (basically, intersecting with all VALORIZA research areas).

5. The circular economy appears as an aggregating element of VALORIZA's different research lines, with contributions in different areas, including the production of energy through biomass or by-products of agricultural activity, but also with activity related to the reuse of materials (as is the case of construction materials), worth highlighting, in addition to the general component relating to the project Guardiões, the participation in the (De)construction for the Circular Economy project, to promote a regional strategy for the reuse of construction products and components, as well as the recycling of construction waste and demolition, thus reducing the environmental impact of the construction and promoting its circularity (project financed by EEA Grants).

These five contributions have the particularity of having direct implications at the level of science, with participation in project activities of a fundamental nature, but they also always mean the existence of applied research activities which, due to the nature of the Portalegre Polytechnic University (PPU) projects and activities, have very relevant effects at the territorial level, as will be identified below.

Related to contributions 1) and 2), it is possible to highlight what was achieved, in particular the recognition of the contribution to society, both nationally and internationally, with the approval of the Hydrogen Academy as an important project of common European interest or the recent approval of the Center of Vocational Excellence H2Excellence: Fuel Cells and Green Hydrogen Centers of Vocational Excellence towards affordable, secure and sustainable energy for Europe. In these fields, reference should be made to the significant number of international and national projects in which VALORIZA participates and coordinates (more than 20), the majority of which are technological development projects on a pilot and demonstration scale and in partnership with business entities. The excellence of the work carried out on these themes is attested by the various training actions for business entities, within the scope of the Academy for Hydrogen, as well as the Roadmap's responsibility for conducting the "Roadmap for Hydrogen", an initiative carried out at the invitation of a government body, and which intended to present and publicize projects and entities in 21 initiatives throughout the national territory.

8

For contribution 3), it is possible to identify the recognition of the research activities, for example, with the fact that the irrigation sustainability project is being used in twelve of the fourteen existing irrigation perimeters in Alentejo, in a sector which consumes about 84% of the water and where it was possible to improve the efficiency of the use of water in 30%. As previously mentioned, within the scope of Guardiões, several international conferences were held, one of which was dedicated to the theme of water, with more than 200 participants and over 40 speakers, having contributed to the national and international projection of the center and enhanced the results of the research in this area in particular, following the existence of funded projects. Moreover, PPU coordinates Inovtechagro, the National Center for Skills for Technological Innovation in the Agroforestry Sector, whose mission is to transfer knowledge, training, experimental development and support for research in the areas of precision agriculture, mechanization and digitalization, and which supported more than 40 applications, including in measures to reduce water consumption.

In the case of contribution 4), the development of that particular project (Guardiões) allowed Alentejo to be transformed into a living laboratory, identifying around fifty quantified measures for the territory, also with recognition of the project, both external and internal, whose relevance at a regional level is notorious, and has already given rise to a new application for funding, with new activities being envisaged. This project also included a wide range of activities, contributing to practical and applied knowledge in various fields, including the holding of five conferences which, in total, had more than 1100 participants and more than 160 speakers, experts in different areas in that the conferences were developed. Moreover, that project has always had a close connection to the television program "Hora de Agir", which aired in Portugal on two generalist channels (still broadcast on one of them), but which has a wide visibility, particularly in all countries of the Community of Portuguese Language Countries.

Finally, regarding the last contribution, the recognition of VALORIZA's activity is visible through the coordination of the Circular Laboratory of Alentejo, a network of multidisciplinary, technology-based development centers, deeply involved with the territory in the construction of solutions for its sustainability, with the aim of providing response to the need to foster a new social, economic, political and cultural awareness, providing a new paradigm regarding resource management in order to promote fairer and more balanced consumption, with an impact on the territory of Alentejo, centered on four thematic lines: Waste and Construction; Agriculture, Production and Use of Water; Energy; and Design.

### 1.3. Completeness of the activity plan

The activity plan that had been outlined included the development of research in the following areas of knowledge:

- 1) FROM WASTE TO ENERGY – Research work based on results obtained with pilot demonstration units and actual waste and effluent from local industries, stimulating sustainable solutions based on circular economy models; develop waste recovery solutions (using both natural materials and construction residues), namely: composite materials for modular construction applications with integration in BIM systems for sustainable waste management and processing.
- 2) CIRCULAR SMART AGRICULTURE – Develop and implement scientific and technological solutions regarding: Efficient water use and storage; Crossing biotechnology, reproduction and plant and animal genetics as a mechanism to improve the productivity and competitiveness of the agricultural sector; Innovation for agriculture, helping farmers put innovation into practice, promoting the development and integration of new technological platforms and technological tools to respond to real problems, while promoting greater resource efficiency.
- 3) SMART ENERGY FOR SMART REGIONS – Develop applied research on energy storage systems that balance demand/consumption and to model energy storage systems to work in smart grids, focused on chemical storage technologies, namely those based on the hydrogen energy vector.
- 4) PREDICTIVE MODELS FOR SUSTAINABLE LANDSCAPES – Research in forest fires solutions to develop predictive models of probability and progression of forest fires; biomass production; agricultural productivity; environmental contamination. By crossing multiple research domains, this specific tool will allow the use of inference models both for defining spontaneous ignitions and patterns of fire propagation and for predicting biomass production, enabling better resource management.
- 5) (NET)-WORK TERRITORIES AS ENTREPRENEURSHIP PROMOTERS - Research focused on: Development of integrated solutions for critical and very sensitive low-density areas with serious assertion problems; Development of comparative empirical analysis of low-density rural regions, examining the impact of context, distance and mobility, innovation, entrepreneurship and governance systems on local attractiveness and development, and the impacts of technological change on rural/urban balance; Establishment of network-territories as drivers for cross-border cooperation, fostering the creation of partnerships and projects supported by clusters linked to endogenous resources (niche markets, designations and geographical indications) and to smart-creative territories.
- 6) HUMAN AND COMMUNITY DEVELOPMENT AS A BASIS TERRITORIAL DEVELOPMENT - Promoting applied research and knowledge transfer able to mitigate the identified problems of this territory, by: increasing cross-border cooperation as a support for development streamlining business/organizational models, based on the specific characteristics of the territory and on cross-border regional good practices; promoting the valorization of material and immaterial heritage, through

research inherent in the creation of tourist and cultural itineraries; developing technological support to cognitive decline resulting from cognitive aging (cognitive orthotics), promoting pilot studies focusing on the application of technological resources for health assessment, monitoring and support for older people residing in low-density territories.

In general, there was developed research work in all areas, evident in the attained competitive projects, in the scientific publications and organized conferences. A significant number of projects were developed on the themes of waste recovery, production of hydrogen and renewable gases, biorefineries, biofuels, circular economy, rational use of water or sustainable agriculture. Also worth mentioning is the number of projects and publications related to the area of the territory centered in the problems of communities and their vulnerabilities.

#### 1.4. Research Lines

##### BIOENERGY AND WASTE RECOVERY

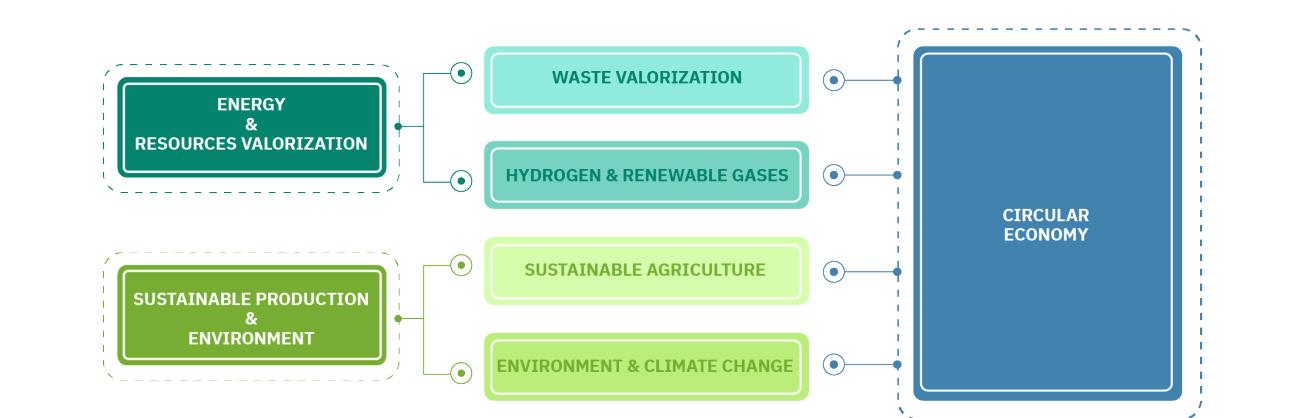

The energy recovery of waste is today an activity whose domain reaches the full extent of human action on the environment, whether rural or urban. Thus, topics such as the development of circular processes for the recovery of waste and effluents, as well as the development of technologies for hydrogen and renewable gases and the development of advanced biofuels constitute areas with profound opportunities.

##### SUSTAINABLE PRODUCTION AND ENVIRONMENT

Sustainable growth is one of the main objectives of the European Union, whose set of adapted policies is based on the premise of addressing the excessive and unaffordable use of natural resources, in order to make production processes more efficient. Therefore, the development of research work focused on topics such as climate change, circular economy, efficient use of water, forestry, preservation and valorisation of resources and animal and plant genetic heritage are fundamental.

##### CIRCULAR ECONOMY

The circular economy is directly related to bioenergy and waste recovery, as well as sustainable production and the environment. However, the circular economy extends its area of research to issues such as the use of waste from other economic activities (such as construction) or issues such as ecodesign, making it also a highly relevant area.

## 1.7. Funding

The information about the execution of the funding component of VALORIZA is presented in tables below. After a difficult beginning, related to the constraints caused by the pandemic, the last years show an increase of execution, strongly related with the commitment to increase the research and to disseminate the results.

**Partner Institutions:** A redução de 50% do consumo de antimicrobianos (setor animal) até 2030 atuando em três eixos fundamentais, HUBRAM, Vigilância RAM e PEMV. Pretende-se criar plataformas que permitam a gestão integrada de dados de vigilância e monitorização de utilização de antimicrobianos em animais (AMC/AMU), incluindo os classificados como críticos pela OMS; a integração de dados RAM, da avaliação epidemiológica de microrganismos comensais e de agentes zoonóticos de interesse. Ou seja, a criação de uma plataforma que integra toda a informação referente à prescrição de medicamentos (incluindo alimentos medicamentosos), informação referente à segurança dos alimentos, vigilância e monitorização RAM, bem-estar e saúde animal. Para tal, terão de ser igualmente criadas interfaces de integração com as bases de dados nacionais, europeias e internacionais. O HubRAM será munido de ferramentas automáticas de análise com base nas quais será possível estudar os efeitos de correlação entre conjuntos complexos de variáveis, implementar um sistema de classificação baseado em fatores de risco, que permitirá uma análise de âmbito nacional e local (referente a uma exploração específica, por exemplo), com vista à recomendação de medidas de intervenção e disponibilizar a informação no âmbito Uma Só Saúde (DGAV, DGS, APA, Academia, Stakeholders).
